

## Infrastructure Services

BlueStorm Technologies, an IBM hardware and software Business Partner, authorized Dell reseller, authorized Lenovo reseller and Microsoft partner, specializes in helping small & medium businesses optimize their networks. Our Infrastructure Services Professionals can help with anything from server set-up & upgrades to desk-side support. We keep up with the IT technologies and certifications in order to provide you the best IT infrastructure for your organization so you can focus on your core business.

Established in 1999, BlueStorm Technologies has built a reputation for providing first-class solutions and service to businesses like yours. Our IT infrastructure focus is on designing and implementing the best framework for the long-term success of your internal networks. This ultimately minimizes downtime and lowers your overall IT expenditure.

## Hardware & Software Solutions

Our partnerships allow us to provide our customers with customized, cost-effective solutions for both hardware and software infrastructure. Servers from Dell and IBM, workstations and laptops from Dell, HP and IBM/Lenovo, software solutions from IBM and Microsoft, as well as customized software solutions from our application developers and systems integrators are all part of our portfolio.

## LAN/WAN Networking

Internet connectivity is now a necessity for any business. We can help you maximize your internal and external network connections. We'll secure your data with firewalls, anti-virus and anti-spam software.

Today's workforce is becoming increasingly mobile as well, so the ability to access your network from just about anywhere your employees can connect to the Internet is also critical. We'll help you implement a secure remote connection to your network with a Virtual Private Network (VPN), so you know only those authorized are connecting to your network.

## Server Optimization and Administration

Utilizing IT "Best Practices", we'll configure, administer and optimize your servers in order to maximize the investment in your IT infrastructure. We can help you increase security and efficiency by helping implement Single Sign-On solutions (utilizing LDAP or Active Directory) and dynamic collaboration environments. Single Sign-On can increase security and help you with regulatory compliance and a simpler way to perform system audits.

## Preventative Maintenance and Ongoing Support

Assessing your IT environment and being proactive before there is a problem is crucial to your overall success. Periodic health checks and proactive management of your network can help maximize your network uptime.

Using advanced technologies like network management & monitoring tools and remote administration, we can help you be more proactive, so you can continue to focus on your core business. However, if a problem should arise, our infrastructure specialists can help get you back up and running quickly.

Also, ensuring that your end-users continue to be able to perform their duties is important. We can help set-up and administer the workstations & laptops connected to your network. We provide ongoing support for these users as well.
